

Tab Complete Ignore Case Sensitivity

If you do a lot of work from command line, you know that tab completion is a very convenient feature. Unfortunately, by default tab completion is case sensitive in OSX. Meaning if you have a case off than tab will not auto complete. Here is how to ignore case for auto completion:

```
echo "set completion-ignore-case On" >> ~/.inputrc
```

Now just restart you terminal session and tab will allow you to auto complete/cycle through commands with out worrying about the case of the letters you have typed
